

EasyScript for Premiere Pro

Auto silence-cut · transcription · speaker labeling · subtitles — directly on your timeline. **Installation & User Guide**

1. Requirements

- **Adobe Premiere Pro 2022 or newer** (macOS or Windows).
- About **3 GB** free disk space (the transcription model downloads on first use — needs internet).
- Apple Silicon Macs (M1–M5) are fastest; Intel/Windows machines also work.

2. Installation

Your package contains: `EasyScript-Premiere.zxp`, a `backend/` folder, the installers, and this guide.

macOS

1. **Fully quit Premiere** (Cmd + Q).
2. Right-click `install-mac.command` → **Open** → **Open** (macOS asks once on first run).
3. The script installs the panel and the backend automatically. Reopen Premiere when it finishes.

Windows

1. **Fully quit Premiere.**
2. Right-click `install-win.bat` → **Run as administrator.**
3. Reopen Premiere when it finishes.

Open the panel: **Window** → **Extensions** → **EasyScript**. On first open the panel **starts the backend automatically** (top corner shows **Connecting** → **Connected**). The first transcription downloads the model (needs internet, a few minutes).

3. Workflow

Step	Action
1 Pick a source	Select a clip on the timeline (or set In/Out marks). Range: <i>Selected Clip / In / Out Points / Entire Timeline</i> .
2 Load Audio	Click Load Audio from Timeline → the waveform appears (exactly the selected part, including trimmed clips and nested sequences).
3 Detect Silence	Finds silent gaps. Click the ⚙ next to "Waveform" to tune sensitivity (padding, dB threshold, min silence).
4 Transcribe	Speech to text. Pick the Model & Language in Settings (⚙).

5 Speakers	Identify who is speaking (needs an HF Token in Settings — see section 4).
6 Apply Cut	Removes silence directly on the timeline (ripples clips closed and keeps audio/video in sync).
7 Make Subtitle	Creates subtitles on the timeline. A dialog lets you pick the original + any translations . Line breaks follow the "Display mode" in Segments.
8 Label Speaker	Cuts at speaker changes & renames each clip to its speaker name.

4. Settings (⚙ button)

- **Model / Language:** choose the transcription model and language.
- **Speakers — HF Token:** a free HuggingFace token is required for speaker identification. Get one at huggingface.co/settings/tokens and **accept the terms** of both models: `pyannote/speaker-diarization-3.1` and `pyannote/segmentation-3.0`.
- **Translation:** choose a translation provider (NLLB-200 / Ollama / Hy-MT2 / Claude API). Download the local model in Settings if using a local provider.
- **Subtitle timing:** subtitles timed *after the cut* or *to the original*.

5. Troubleshooting

Symptom	Fix
"EasyScript" not in Extensions	Run the installer again, then fully quit & reopen Premiere .
Panel stays Offline	The backend isn't up. Reopen the panel (it auto-starts the backend). The first run may take a few minutes to download the model.
Speakers shows a token error	Enter your HF Token & accept the two pyannote model terms (section 4), then Save Settings.
Nested audio sounds empty	Make sure the sequence has audio; try again — the render is auto-normalized.

Note: EasyScript never modifies your source files. All cuts/renames apply to clips on the timeline — you can Undo (Cmd/Ctrl + Z) at any time.
